ENGINEERING

Engineering & CTO Workstation: README

Who this is for: Engineers, DevOps and technical leads.

Build, deploy, secure and operate RideArrivo software while preserving controlled engineering ownership. Software delivery, infrastructure, mobile, releases, security and technical operations.

1. Your first 15 minutes

- Sign in and check the Dashboard: notifications, what needs your attention and your tasks.
- Open this workstation from the left menu and read the section list below once.
- Find your colleagues in Chat and say hello in the department room.
- Open ROOM 7 and note where meetings start, so the first call is not a scramble.

2. What you can do here

Area	What it is for
Source Control & Review	Repositories, issues, pull requests, branch protection and review workflows.
Planning & Delivery	Backlog, milestones, technical tasks, release scope and engineering ownership.
CI/CD & Releases	Builds, tests, deployments, approvals, release notes and rollback readiness.
Infrastructure	Supabase, Render, Cloudflare, environments, DNS and production services.
Observability	Errors, tracing, performance, logs, uptime and production diagnostics.
Product Analytics	Feature adoption, funnels, session replay, experiments and feature flags.
API & Integration Centre	OpenAPI, Postman collections, webhooks, health checks and third-party integrations.
Security & DevSecOps	Secrets, dependencies, access, code scanning, audit and incident hardening.
Mobile Delivery	Android/iOS builds, signing, store releases and device testing.
Design & Architecture	Figma, system design, ADRs, schemas and technical roadmap.

3. Tools and shortcuts

Tools open in a new browser tab and use your own sign-in to that service. Request access from Administration if one is missing.

Tool or link	Use it for
Supabase	Database, authentication, storage, realtime and Edge Functions.
Render	Backend services, deployment and runtime logs.
Cloudflare	DNS, edge delivery, security and Pages deployments.
Sentry	Application errors, tracing, performance and production diagnostics.
PostHog	Product analytics, session replay, experiments and feature flags.

Tool or link	Use it for
Figma	Product design, prototypes and design-system collaboration.
Postman	API collections, testing and integration diagnostics.
ParAsYtE Linux (inside the workspace)	Secure engineering terminal and persistent project workspace.
PArAsYtE Browser (inside the workspace)	Open approved engineering web consoles inside the workspace.
Applications (inside the workspace)	Approved internal and managed engineering applications.

4. A working day

Start of day

- Check Observability (Sentry, PostHog) for new errors and any release from yesterday.
- Review open pull requests in Source Control & Review.
- Check Security & DevSecOps for open findings.

During the day

- Ship through CI/CD & Releases. Do not deploy by hand around the pipeline.
- Use ParAsYtE Linux and the PArAsYtE Browser for work that needs the secure environment.
- Change production data only through reviewed migrations.

End of day

- Leave the main branch green.
- Write down anything half done in the ticket, not in your head.

5. Security and handling

- **Your login is yours.** Never share it, and never sign in on a shared or public computer. Use **Keep me signed in** only on a device that only you use.
- **Lock or sign out** when you step away. Use the sign-out option at the end of the day.
- **Customer and company data stays in company tools.** Do not copy it into personal email, personal cloud drives or chat apps outside RideArrivo.
- **Company Files downloads need approval.** Open documents in the workspace first. Request a download only when you truly need the original.
- **Report problems early.** A lost device, a suspicious email or a wrong access level is reported to Administration the same day.

For this department
• Secrets and API keys never go in chat, tickets or git. Use the platform's secret store.
• Production access is least-privilege. Ask for what you need and give it back when done.

6. Getting help

Ask in your department room in Chat first. For access, accounts or anything that looks wrong with the workspace itself, message Administration with a screenshot and the time it happened. If you think your account or a device has been compromised, say so at once.

Read-only guide, published by the engineering team. Version 3.0. If the app and this guide disagree, the app is right; tell Administration so the guide can be corrected.
