SECURE ENGINEERING ENVIRONMENT

ParAsYtE Linux: README

Who this is for: Engineers with approved access.

ParAsYtE Linux is a secure terminal inside the workspace. Use it for engineering work that needs a controlled shell, instead of working from a personal machine.

1. Your first 15 minutes

- Sign in and check the Dashboard: notifications, what needs your attention and your tasks.
- Open this workstation from the left menu and read the section list below once.
- Find your colleagues in Chat and say hello in the department room.
- Open ROOM 7 and note where meetings start, so the first call is not a scramble.

2. What you can do here

Area	What it is for
Terminal	A shell in your browser. The status bar shows Connected, Connecting, Attention or Disconnected.
Terminal size	Choose Normal, Expanded or Maximized, or use the maximize button.

3. A working day

Start of day

- Open ParAsYtE Linux and wait for the status to show Connected.
- Choose the terminal size that suits your screen.

During the day

- Keep sessions short and purposeful.
- If the status shows Attention or Disconnected, reload and reconnect before trusting any output.

End of day

- Exit your session and close the tab.
- Do not leave long-running work that nobody owns.

4. Security and handling

- **Your login is yours.** Never share it, and never sign in on a shared or public computer. Use **Keep me signed in** only on a device that only you use.
- **Lock or sign out** when you step away. Use the sign-out option at the end of the day.
- **Customer and company data stays in company tools.** Do not copy it into personal email, personal cloud drives or chat apps outside RideArrivo.
- **Company Files downloads need approval.** Open documents in the workspace first. Request a download only when you truly need the original.

- **Report problems early.** A lost device, a suspicious email or a wrong access level is reported to Administration the same day.

For this department
• Never paste secrets, tokens or customer data into the terminal.
• Everything you run can be audited. Run only what you are authorised to run.

5. Getting help

Ask in your department room in Chat first. For access, accounts or anything that looks wrong with the workspace itself, message Administration with a screenshot and the time it happened. If you think your account or a device has been compromised, say so at once.

Read-only guide, published by the engineering team. Version 3.0. If the app and this guide disagree, the app is right; tell Administration so the guide can be corrected.
